

Abstract

A method and a device for supply of a dialyser (1) in a dialysis unit with dialysis fluid is disclosed. At least one dialysis fluid concentrate is mixed with water to produce the dialysis fluid. The dialysis fluid concentrate is prepared in a reservoir unit (12, 13) in a given amount. A control and arithmetic unit (24) calculates the dialysis fluid rate (Q_d) such that, after a given treatment time (T_{SB}) has passed, a given residual amount of dialysis fluid concentrate or no residual amount remains in the reservoir unit. It is preferable to empty the reservoir unit by the end of treatment.
